

# Team Developer 5.1 SP1 Release Notes.

## Some Patch details.

- Once Team Developer 5.1 SP1 patch is installed you can not rollback to Team Developer 5.1
- The SP1 MSP patch has been archived into an executable.
- Web Application Manager was not installed in base release of Team Developer 5.1 and is now automatically installed with the patch. Also it is registered as a windows service.

## Strict syntax type checking is now enforced.

Team Developer 5.1 and above is now unforgiving if you do not declare parameters or return types correctly.

## Using a theme other than the default themes provided.

In order to choose a theme other than the default themes provided you will need to do the following:

- Install the new theme supported by the OS. In XP you need to copy the new theme to the directory: ..\WINDOWS\Resources\Themes\
- Open the "Display Properties" dialog. (i.e. go to the desktop, right click and select properties)
- Select the theme you just added in the "Theme" combo box and click OK.
- In the Team Developer IDE click on the "Native Windows XP" theme in the build settings dialog and build the application.

## Reverting back to WinHelp

Due to the negative response to WebHelp it was decided we would revert back to WinHelp. WinHelp is much faster and provides context sensitive help. The initial thinking behind going to WebHelp was because WinHelp was not being supported in Vista. For Vista users you will need to download WinHlp32.exe from microsoft download site.
